

# Soil Moisture Estimation Using Active DTS at MOISST Site

June 4, 2014

**Chadi Sayde, Daniel Moreno, John Selker**

Department of Biological and Ecological Engineering  
Oregon State University, USA

# Measuring Temperature with DTS

## Optical fiber

Kevlar Fibers  
for Strength

Plastic Buffer  
Coating

Protective Outer  
Jacket

Glass  
Fiber  
50  $\mu\text{m}$

Fiber diameter 0.9 mm  
Black and white jackets

Every 1 s (1 Hz)

25 cm

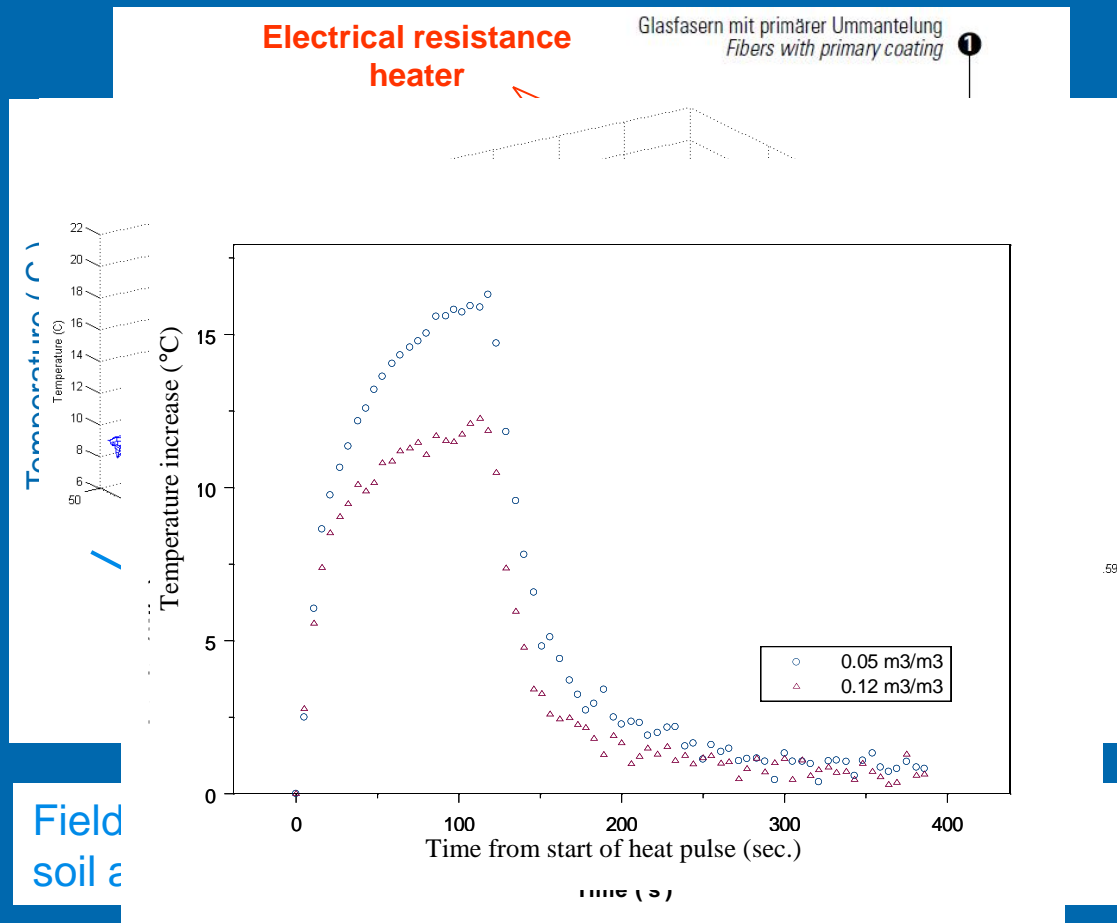

# Measuring soil moisture content

## Actively heated

Heat injected in soil along fiber optic cable

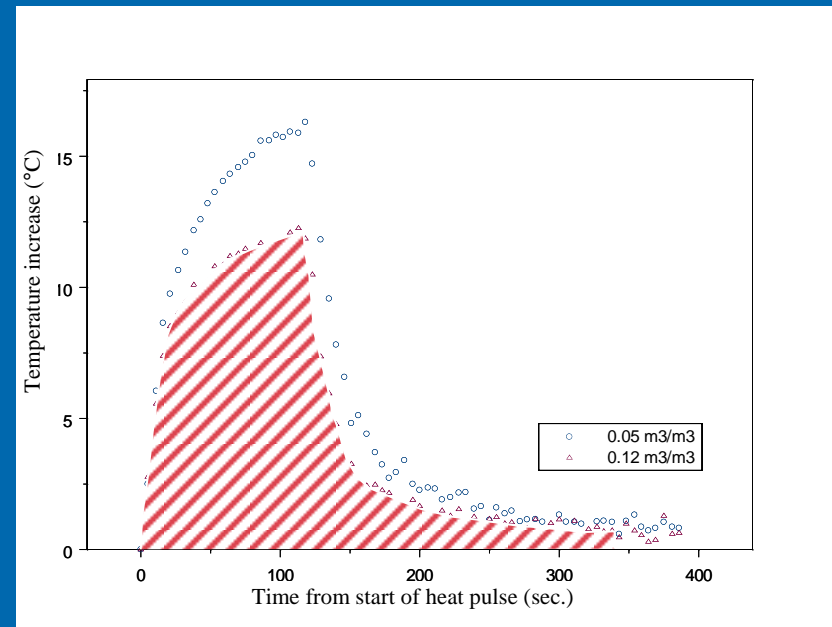

DTS reads temperature changes during heat pulse along fiber optic cable

Soil water content inferred from thermal response of soil to the heat pulse

# Heat Pulse Interpretation: The Integral Method

$$T_{cum} = \int_{t_0}^{t_j} \Delta T dt$$

$T_{cum}$  is the cumulative temperature increase

$t_0$  is the time to start of a heat pulse

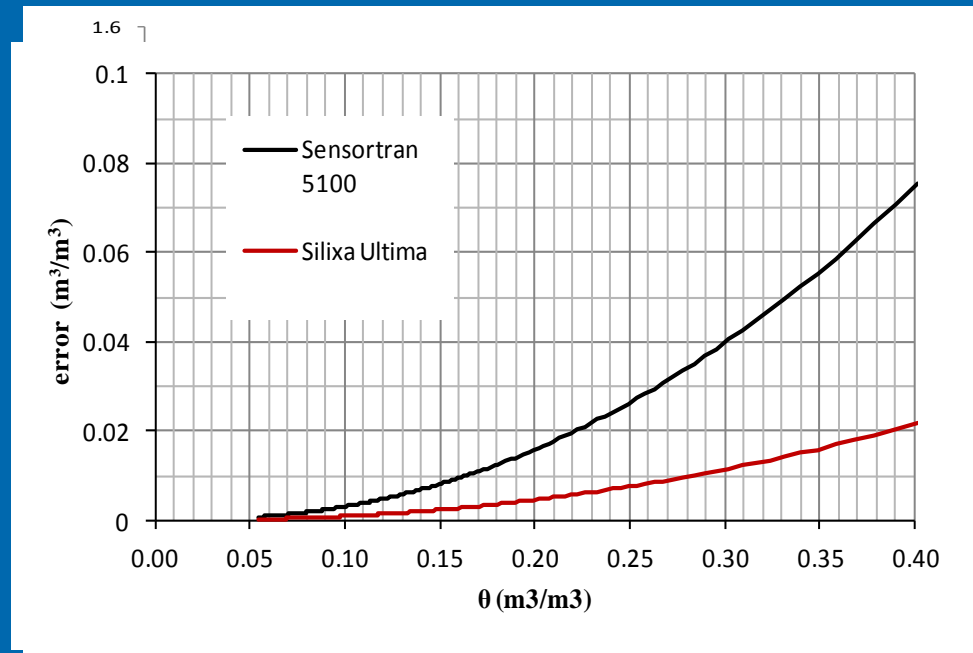

$t_j$  is the total time of integration

$\Delta T$  is the temperature increase over ambient temperature.

# Calibration Curve

Calibration curve relating the degree of saturation ( $S$ ) to  $T_{cum}$  normalized by its value at saturation

Error in soil water content estimation due to the DTS system performance for samples collected from the calibration soil column using KD2 probe

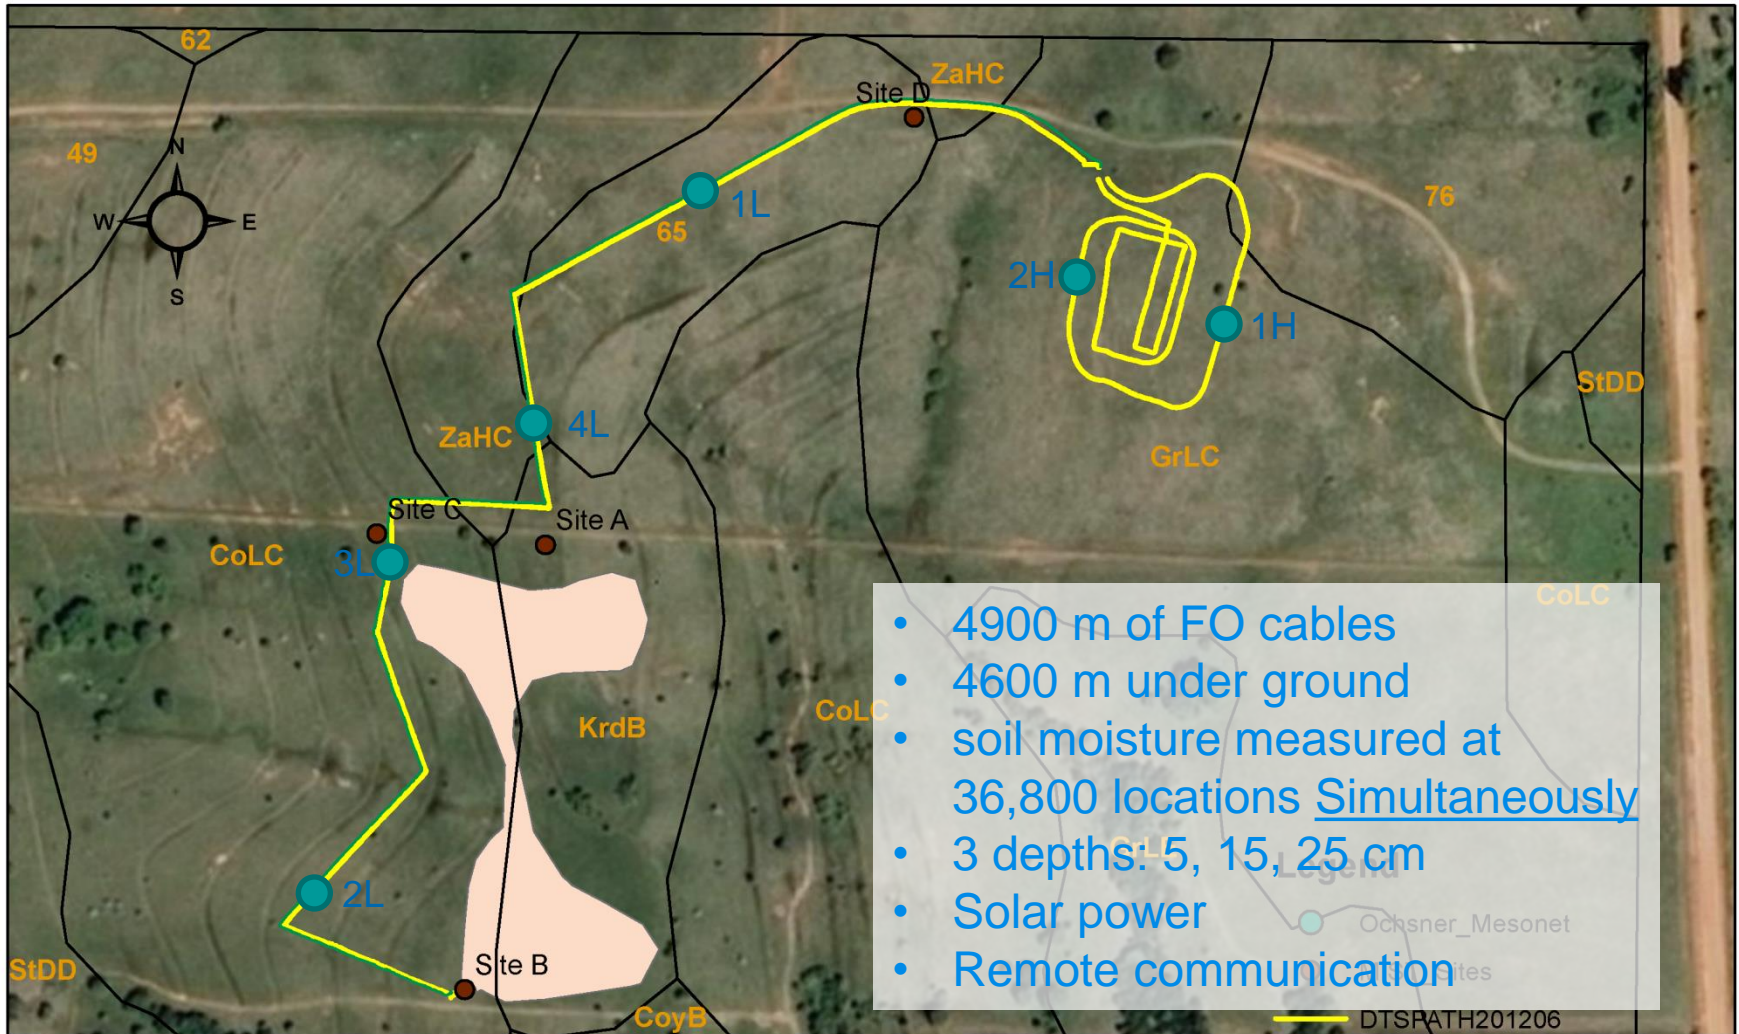

# Interpretation of satellite soil moisture products with ultra-high resolution fiber optic and cosmic ray ground-based measurements.

- **Funding agency: NASA**
- **Location: Stillwater, OK**
- **Objectives:**
  - **Better understanding of spatio-temporal variation of soil water content**
  - **Calibration / Validation remote sensing data**
  - **Downscaling remote sensing data**

# Fiber Optics Cable Path

Existing FO cable

# Precipitation recorded at the site and Soil Water Contents measured at Stations 1H and 2H

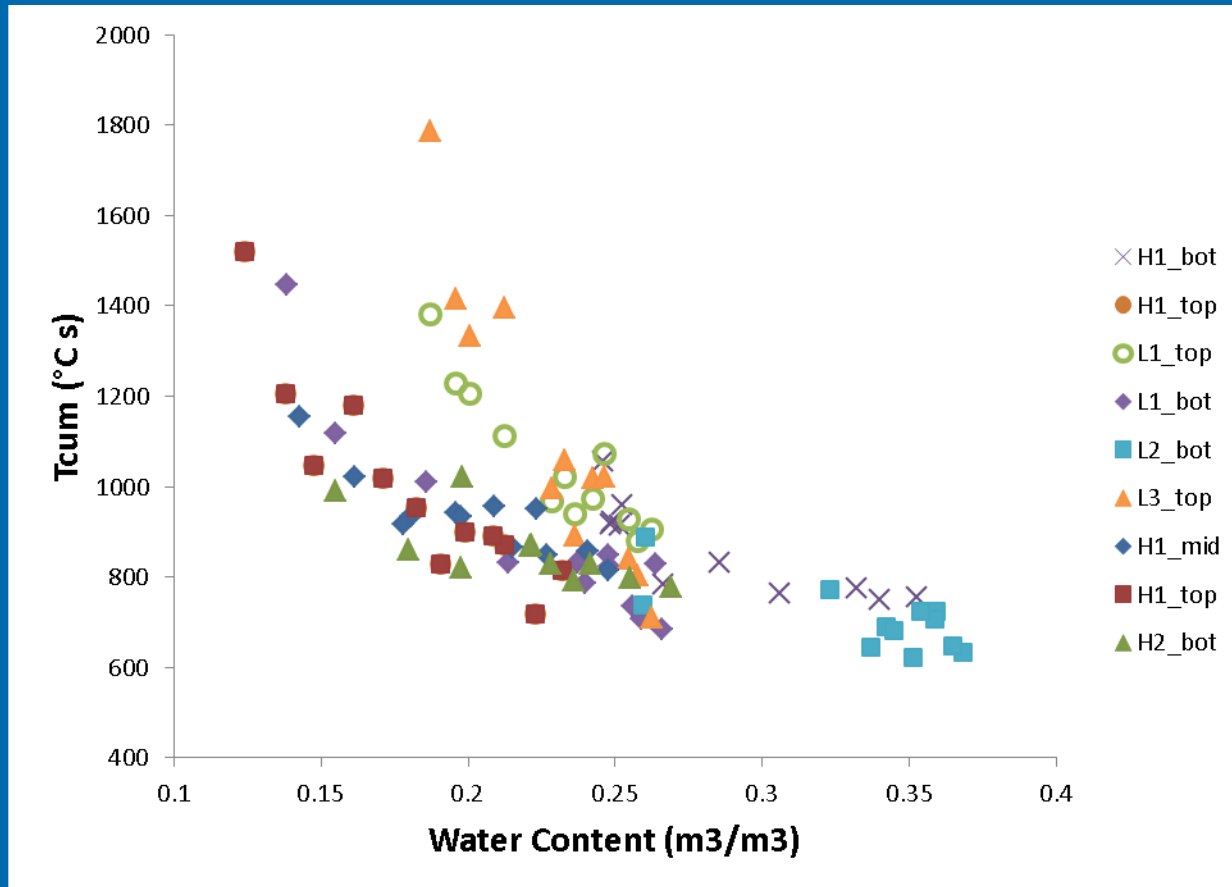

# Tcum vs. soil water content measured at stations 1H and 2H in August, 2013

# Spatial Variability of Soil Thermal properties

# Precipitation recorded at the site and Soil Water Contents measured at Stations 1H and 2H

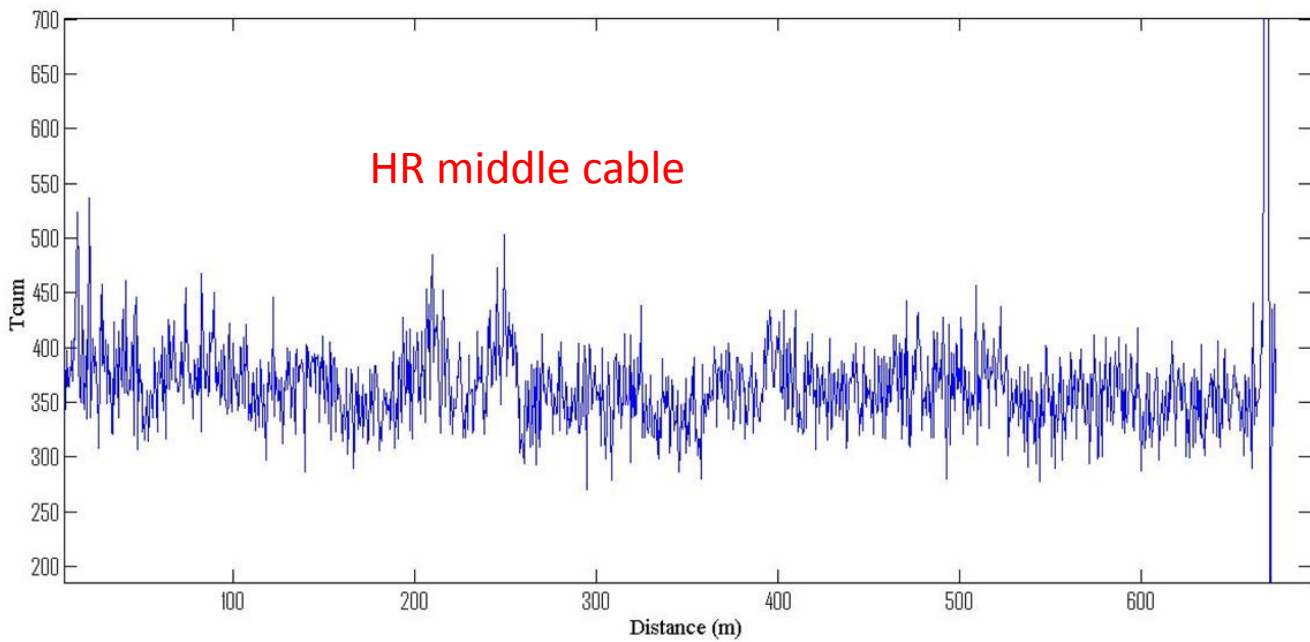

June 1, 2013 – Tcum from 4 min  
heat pulse

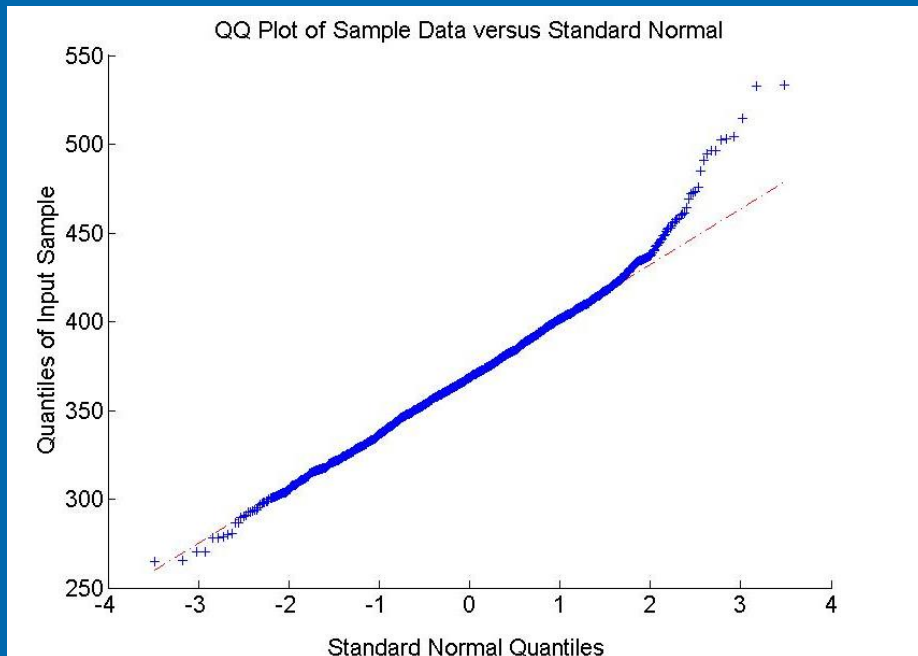

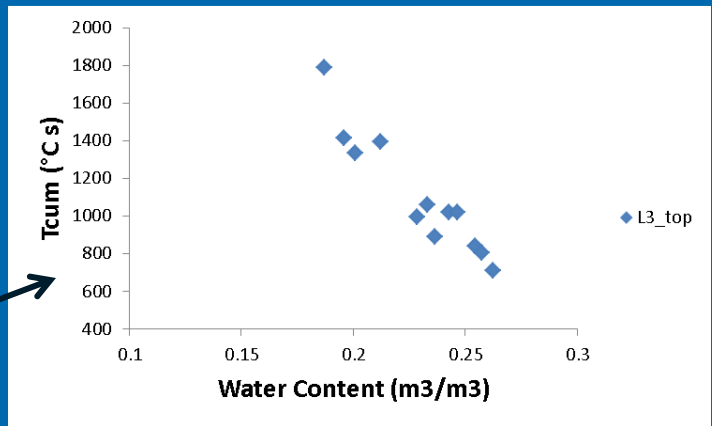

# Histogram of Tcum on June 1, 2013

Saturated soil after heavy rainfall

# Future work: Increasing Calibration Accuracy

## Generate distributed calibration curves:

- Thermal response curve generated from non disturbed samples
- Strategic detailed surveying of soil water content and soil thermal properties
- Calibration curve could be produced by few measured  $T_{cum}$ - $\theta$  couples per location
- Vegetation and topography indices

# Ultra High Resolution **LIDAR** mapping of the site

## July 20-25:

- 1X1 mile to be mapped
- 3 LIDAR types: 2 copters, ground
- Horizontal resolution <6cm
- Color aerial mosaic and orthophotos <2.5 cm
- Near infrared and NDVI

## Products:

- Surface micro-topography
- Canopy height, above ground biomass
- Vegetation type?

Source: USGS

# Summary

- Active DTS Soil Moisture product available in the summer
- Distributed calibration
- Dynamic calibration: Increased accuracy with more data integrated
- High resolution LIDAR micro-topography and vegetation height maps:
  - Improving the accuracy of DTS products
  - Effects of micro-topography on Hydrologic processes in the field
  - Upscaling DTS soil moisture

Thank You!
